

SWARCO TRAFFIC SYSTEMS GMBH

IG315/2 User manual

Subject to technical modifications.

www.swarco.com/sts

1 Introduction

On the following pages you will learn how to install and operate the device in an appropriate way. We attach great importance to the safe, appropriate and effective handling of this device. It is therefore important to read this manual thoroughly before using the device.

1

© 2010 All rights reserved

In the manual you will find important instructions helping you to avoid danger and to prolong the reliability and durability of the device and the accessories

For your own safety you should read the safety instructions. Follow the instructions closely in order to avoid danger for yourself and others or damage to the device.

If you have any questions about the IG315/2, which are not answered in this manual, or if you have problems understanding the descriptions, please contact:

> SWARCO TRAFFIC SYSTEMS GMBH **Business Unit Detection** Niederkircher Straße 16 D-54294 Trier detection@swarco.de

1.1 Usage according to regulations

The IG315/2 is solely suited for the detection of vehicles. Any further usage is not appropriate. Do not use the IG315/2 for any other purpose.

1.2 Label

The IG315/2 is provided with a quality label / serial number. You will need these indications when talking with the customer service, e.g. ordering accessories or spare

2

Note here the serial number and name of the device in order to have them available when needed:

Serial number:

Voltage version:

CE-label: (€

1.3 Further documentation

Notes on loop installation

1.4 Symbols

In several places throughout this manual you will find the following symbols stating important safety instructions:

ATTENTION!

This symbol indicates dangers which might cause damage to people or property.

This symbol indicates information for installation and function of the device.

1.5 Safety instructions

Read the following safety instructions thoroughly and observe them carefully. They are stated to ensure your own safety and the safety of others and to avoid damage to the device or accessories.

3

ATTENTION!

Danger of electricity! Make sure that no liquid may get inside the device. If this happens, interrupt the power supply to the device at once.

If you notice any damage, e.g. broken or crushed cables, damaged plugs, enclosures etc., turn off the device at once, interrupt the power supply and make sure that the device cannot accidentally be turned on again.

The device may only be installed, brought into service and repaired by an electro-technical expert. Inappropriate operation, improper maintenance or not observing the instructions in this manual can lead to danger.

Any malfunction of the device which may limit the safety of its users or others must be removed immediately. All warning and safety labels on the device must be observed and kept complete and legible.

The appropriate usage must be observed by all means. For damage resulting from inappropriate usage the manufacturer will not undertake any liability.

The device must not be used as a safety component in the sense of the European Directive 98/37/EC ("Machinery Directive"). In systems with high risk additional safety measures are necessary.

The operator of the device must ensure that the chosen means of operation will not cause damage to material or danger to people and that all security and safety installations are present and functioning.

Before installation and first operation, please observe the instructions in the manual.

The manual must be available at the site of usage at any time. It must be read thoroughly and applied appropriately by the person responsible for the operation, maintenance and service of the device.

Our products are in a constant process of improvement and advancement. Because of this, read the current manual thoroughly before installation and first operation.

Without prior consent of the manufacturer, no modifications, neither mechanical nor electrical, may be done. Only parts that have the consent of the manufacturer may be used for backfitting or as accessories. Any violations will lead to the termination of conformity and the manufacturer's warranty. The user will subsequently bear the risk (the Declaration of Conformity is available at www.swarco.com/sts)

2 Product description

2.1 Features

The induction impulse transmitters IG315/2 evaluate the loops in the ground. Those depict the inductivity of a high-frequency oscillator circuit. If a vehicle crosses the loop, its metal components cause a change of frequency in the oscillator circuit. These are analysed by the loop detector, transmitted as switching signals via floating relay contacts and displayed on the front LEDs. The analysis of the loop frequency is done via a micro-processor system which aligns automatically to the according loop and compensates changes of the loop inductivity caused by temperature, humidity or aging of components. The induction impulse transmitter IG315/2 is a 1-channel unit, which means that this device can connect to and evaluate one induction loop

2.2 Switching outputs

The switching output is coupled with the LED display (A) on the front panel (see 4). There are two switching outputs available. Relay A is switched as static signal or impulse for the mode "loop occupied". Relay B emits an additional impulse or can be activated as switching output for the failure report (ERROR) via the operating units on the front. All switching outputs are equipped with electro-mechanical relays

5

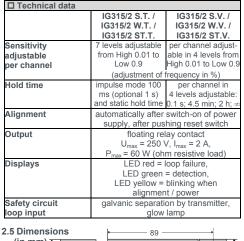

2.3 Parameter adjustment

Via the DIP-switches on the front the following parameters can be adjusted:

- sensitivity
- hold time
- frequency of the measuring system
- switch-off delay
- B-relay as fault report, (instead impulse relay)
- impulse when leaving the loop
- switch-on delay
- automatic alignment
- detection by fault

2.4 Technical data

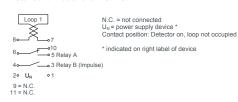

□ Technical data				
	IG315/2 S.T. / IG315/2 W.T. / IG315/2 ST.T.	IG315/2 S.V. / IG315/2 W.V. / IG315/2 ST.V.		
Power supply	230 V AC: (-10 - +6) % / 4,5 VA (50 Hz: +/-0,5 %) resp. 24 V AC/DC: +/-10 % / 3 VA			
Operating temperature	-25°C to +70°C			
Storage temperature	-40°C to +80°C			
Safety	IP30 □			
Enclosure (plastic)	I = 75 mm, w = 37 mm, h = 68 mm			
Connection	via 11-pin connector (type 78-S 11); dimension of socket manufacturer-dependent			
Weight	240 g			
Inductivity range	recommen	H (see also 6.1), ided range: uH at max. 30 Ω

9

3 Installation of the IG315/2

For the use of the device in a surrounding with higher protection requirements, SWARCO TRAFFIC SYSTEMS offers special enclosures (type GHIG300 / GHIG301).

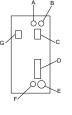

Before switching on the power supply, the device must be plugged onto the socket.

3.1 Special notes on the loop

The safe functioning of the device depends essentially on the technically proper installation and laying of the loops, since the loops are the sensors of the device. The loop feed cable must be drilled approx. 20-50 times per meter and must be laid in distance from life wires. For further information see notes on laying of loops (available at www.swarco.com/sts).

4 Device adjustments

After every device adjustment a new alignment must be effected by pushing the reset-button (E).

4.1 Adjustment of sensitivity and hold time

IG315/2 Version "Tor" (gate) (Type: IG315/2S.T. / IG315/2W.T. / IG315/2ST.T.)*

channel switch (C)		S1	S2	S3	hold time: S4
sensitivity	7 (high)	on	on	on	on=impulse / off=static
	6	off	on	on	17
	5	on	off	on	
/	4 (med)	off	off	on	47
/	3	on	on	off	43
,	2	off	on	off	43
	1 (low)	on	off	off	
test mode relay released		off	off	off	off
test mode relay tightened		off	off	off	on
1 6 11 111				41 1 114	

default setting: sensitivity 4 (med) and static hold time.

sensitivity: adjustable in 7 levels

channel switch (C) S1-S3

hold time:

static (presence) or impulse 100 ms

channel switch (C) S4

IG315/2 Version "Verkehr" (traffic)

4 (hia

1 (low

3 2

(Typ: IG315/2S.V. / IG315/2W.V. / IG315/2ST.V.)* indicated on right label of device

channel switch (C)

	S1	S2	S3	S4	hold time
h)	on	on	on	on	0,1s
	off	on	off	on	4.5min.
	on	off	on	off	2h
r)	off	off	off	off	00
t	off	off	off	off	
d	off	off	off	on	

default setting: sensitivity 3 and 2h hold time.

sensitivity:

sensitivity

adjustable in 4 levels

test mode relay released

test mode relay tightene

channel switch (C) S1-S2

hold time:

adjustable in 4 levels

channel switch (C) S3 - S4

4.2 Adjustment of frequency

with the frequency switch (G) S1-S2 in order to avoid couplings caused by nearby loops. Two or more detectors must not operate on the same frequency.

frequency switch (G)		S1	S2	
frequency	4 (high)	left*	left*	1
	3 [7	right*	left*	(
	2 /	left*	right*	
	1 (low)	riaht*	riaht*	(

*position of switches see also front panel)

default setting: 4 (high)

12

15

18

4.3 Function selection switch (D)Switch 1 on The switching signal is switched-off with a delay Switch-off delay of 2 seconds after the loop is vacant (not in imoulse mode).

Switch 2 on B-relay as fault report

10

B-relay switches when detector fault. The function B-relay as impulse relay is invalid. The "impulse output" or "impulse when leaving the loop" can be emitted on the main relay (channel switch (C) switch 4 on / function selection switch (D) switch 3 on). The detector switches the B-relay only after the

Switch 3 on mpulse when eaving the loop active

loop is vacant. The channel adjusted to impulse node and the additional switch-off delay has no nfluence on the "impulse when leaving the oop". In static mode the impulse is only emitted after the A-relay is released. The switching signal is emitted when the loop is

When there is a loop fault, the detector aligns

anew automatically after approx. 12 seconds. If

the fault lasts for a longer period of time, the de tector keeps trying to align until the fault is

eliminated. The relays and LEDs stay in "fault"

on. For a combination with switch 6 on, switch 5 must by all means rest on off, since otherwise the detector aligns anew after 12 seconds and a vehicle which might stand on the loop will not be

attenuated for more than one second.

position until the alignment is effected. A loop fault is indicated on the LEDs and addionally the according channel relay is switched

Switch 4 on Switch-on delay

Switch 5 Automatic alignment active when fault

Switch 6 on Detection by

5 Alignment and fault diagnosis

5.1 Alignment

11

When switching on the power supply, when there are voltage interruptions or when the reset switch (E) is pushed, the loop detector automatically aligns itself to the connected loops and switches the relays to switching position "loop not attenuated". During the alignment period the yellow power-LED (F) is blinking for a few seconds. With a low sensitivity the detector is ready for operation at once. After the alignment the power-LED (F) keeps glow-

14

During the alignment phase there may be no vehicle on the loop since it will not be detected.

Display of switching and failure status

The switching mode "loop occupied" is indicated by a glowing green channel-LED (A).

Loop failure caused by a short-circuit, an interruption or a loop inductivity outside of the permitted range is indicated by a glowing red channel-LED (B).

5.2 Detection and correction of errors

Description	Possible cause	Correction	
Detector does not align, yellow LED does not glow	There is no power supply for detector	Check connection to power supply	
Red LED glowing, green LED blinking long, long, long	Detector detects "loop interrupted"	Check loop and loop connection	
Red LED glowing, green LED blinking short, long, short	Detector detects "loop short-circuited"	Check loop and loop connection	
Yellow and green LEDs glowing, relay permanently tightened	Test mode relay tightened is active	Deactivate test mode (see table Adjustment of sensitivity and hold time	
	Loop is moved mechanically	Control laying of loop, observe documentation "Laying of loops"	
Detector does not switch in spite of effected alignment	Test mode re- lay released is active	Deactivate test mode (see table Adjustment of sensitivity and hold time	
	Chosen sensitivity is too low	Progressively increase sensitivity until vehicles are detected correctly	

13

Description	Possible cause	Correction
	Vehicle mo- vement on the loop	Keep loop clear during alignment
	Loop is moved mechanically	Control laying of loop, observe documentation "Laying of loops"
	Electromag- netic coupling onto the loop	Eliminate cause of cou- pling, observe documen- tation "Laying of loops"

After every change of adjustment resp. correction of error the reset button (E) must be pushed!

6 EC Conformity

6.1 Requirements for the usage according to regulations

Requirements acc. to ETSI EN 300330-1 (2002-12) For the antenna factor (loop area A in m² multiplied by the number of loop windings N) the following is

imperative: N*A ≤ 60 m²

Product Class 2:	
Maximum length / width	30 m
Area	< 30 m ²
Number windings	≥ 1

Product Class 3:	
Area	> 30 m ²
Number windings	1

Constraints for the compliance with EN 300330-1

According to the stated formula, the following loop windings in dependence to the loop area are recommended:

Product Class acc. to EN 300300-1	Area	Number windings	L _{loop} [µH]
2	$(1 - 3) \text{ m}^2$	6	100 - 300
	$(3 - 5) \text{ m}^2$	5	80 – 260
	(5 – 10) m ²	4	160 - 320
	$(10 - 15) \text{ m}^2$	3	180 – 280
	$(15 - 30) \text{ m}^2$	2	80 – 180
3	$(30 - 60) \text{ m}^2$	1	40 - 100

Operating frequency range (L = 15 μH – 400 μH) 20.05 kHz < f < 70 kHz

Total inductivity (loop + feed cable): Specification: L_{total} < 400 µH

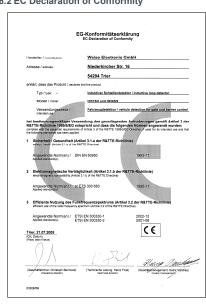

17

Loop inductivity 200 μ H; feed cable inductivity < 200 μ H with 100 μH / 100 m: length of feed cable < 200 m

Requirements acc. to DIN EN 60950

The device has basic insulation

6.2 EC Declaration of Conformity
